Book Descriptions:
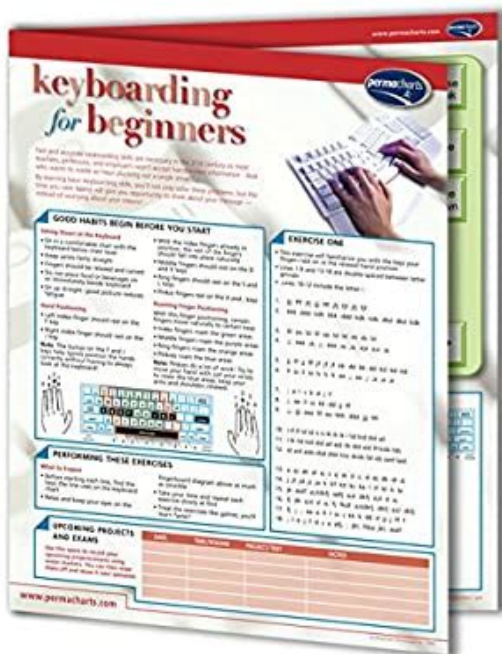

Computer manuals for beginners

It will teach basics moving slowly toward more advanced topics. The primary learning technique will be tutorial examples since they facilitate learning more effectively. There will be adequate theory prior to and explaining the examples so the user learns what the computer is doing instead of just memorizing keystrokes and mouse clicks.However, the theories in the book are applicable to any modern operating system ex Linux, OSX, Solaris; these operating systems will not be explained separately right now unless there are fundamental differences.Policies and guidelines Contact us By using this site, you agree to the Terms of Use and Privacy Policy. There are also a lot of web sites provided that cover a wide area of interests. This reading material is systematic, well laid out logically and easy to follow. It is a sure fire and will get any newbie up and running quickly.The comments Ive gotten back from my customers is that they find this book easy to read and understand and its understanding that is the most important part. For any selfhelp type of book to be useful folks need to understand what it is saying. My customers like the fact that they can take it at their own pace and not feel concerned that they will break the computer while they are trying new stuff. Oh sure, I would love to make tons of money spending hours with my customers training them on how to use their computer, but most people dont have that kind of money these days. This book lets them get more enjoyment and use out of their computer investment. One note, this book is written for Windows 7, so I dont recommend it for other operating systems.So, if you are looking for a book that says more than the absolute basics this is the book for you. Other than that, the book is written in a entertaining style with a lot of basic information. This is a good book to get if you want the absolute basics.When anybody asks me for help learning, I point this book out and start them off with it. It has all the basics you need to know. You can use it for quick reference and to learn how to get around on your computer. The book is WELL worth the money you spend on it. Now there is the 5th edition it is even better yet. The 5th edition has Windows 7 for persons buying new computers. We have purchased over 15 books to learn the basics.It elaborates extensively on every part of a computer from the very basics from what to look for when purchasing to how to search the web and buy products safely online. It even gives a basic list of websites for general use.

I was very amazed with the content of this book, I even learned some new tricks myself and I think I am going to by a copy just for myself as well. Recommend to anyone from completely computer illiterate or to the pretty savvy and just needing a handy reference.It is an excellent resource for anyone who has a fear of using the computer. Very easy to read and follow and not a lot of technical mumbojumbo to confuse the Absolute Beginner. I highly recommend this book for any senior just learning to use the computer. I personally purchase this book for each of my students and they are thrilled to have a book they can understand!I started as a complete computer illiterate, but everything I read to gain a little knowledge assumed that I knew some basics. WRONG !!!! This book is a gem. Read it cover to cover, or look up your question in the index.its all written in language that the older generation can understand.Dont think that youre going to learn by reading the owners manual.chances are you wont. I have a laptop but there is such a commonality of information here so if you too have a laptop, dont let that dissuade you from getting the book. It is clear and easy to understand, even for newbees. ooAs I had been dealing with young people up to NVQ level 3 I was worried I might pitch my training sessions too high so I bought this book along with several others to help bring me down to earth and look at things through the eyes of someone not familiar with computers. The book was exactly what I wanted, basic but not stupid. It covered Windows 7 and went through the various steps in a logical manner. As it turned out my students had even less knowledge than I had anticipated and the basic explanations were just what I needed combined with lots of demonstrations and practice. Highly recommended but not for someone who has purchased a computer with Windows 8 as its O.S.Sorry, we failed to record your vote.

The computer accesses its commands from the operating instructions in the software and then performs the tasks specified in these instructions. Computer users can purchase a host of software, including word processors, graphic editors, databases, games, and more.

Software has to be compatible with a computer operating system, such as Windows, Mac OS, and Linux. A computer becomes unusable if it does not have software installed onto it. An operating system typically has software programs already installed onto it. In addition, numerous software programs can be found online totally free of charge. A computer has an electronic phone book, calendar, notepad, address book, daily planner, files, and folders. The latter two replaces manila folders and filing cabinets, huge space wasters in any environment. People can use their computers to watch television and DVDs. Computers can play recorded music and streaming live audio. Computer technology has rapidly advanced to the point where people can upload entire photo

albums, send electronic mail, and make long distance calls at the same time. More importantly, computer technology has increased its userfriendliness, making it easily accessible for those limited by mental and physical constraints. For instance, the Central Processing Unit CPU, the computer "brain," processes millions of bits of information per second. The CPU processes this information consistently and accurately, making it unique to the human brain. The human brain processes information faster than we realize; however, it also discerns information as it passes through its receptors. A computer does not think for itself, which means it cannot comprehend the tasks it executes. The two major CPU manufacturers are Advanced Micro Devices AMD and Intel. Both of these manufacturers produce integrated circuits, or chips, and perform optimally. A dual core CUP includes two processors in a single circuit. Dual core processors also come with two execution cores, making them ideal for multitasking environments. Casual computers typically do not need a dual core CPU, unless they perform intensive video work or play highresolution video games.

Professional computer jobs usually require working with dual core CPUs, especially since these occupations require computers with ample Random Access Memory RAM. Many computer users refer to RAM as the main working area executing tasks with stored data. In other words, RAM functions like an office desk, whereby workers can open files, retrieve reports, and place them in working order. RAM comes in the form of sticks that look like the size of a few sticks of gum. Most computers have open slots that a technician can use to add or replace RAM. RAM can have information written to it. In addition, the computer reads RAM to find the information written to it. RAM erases itself when a computer user shuts down their computer effectively. The recommended RAM varies according to a computers operating system OS. For instance, Microsoft requires 1 gigabyte GB RAM for 32bit, or 2 gigabyte RAM for 64bit processors for Windows 7. The recommended RAM for Microsoft 7 will vary according to the tasks carried out on the operating system. Read Only Memory ROM stores all of the basic computer instructions needed to do very simple tasks. ROM never changes, even if the computer loses its power. The CMOS stores information about the computer system, including its current date and time. The CMOS needs electricity to continue working; however, it only needs a very small amount of it. To put it in perspective, a small battery will keep it working for 4 to 5 years. If the CMOS battery dies, then the computer malfunctions and will not startup correctly. Therefore, the computer user will need to have it replaced. In addition, the computer user will probably have to reenter all of their setup information about the computer system. Casual computer users may group files into folders that make up a directory. Computer users can find these groups of files, also known as subfolders, together in another folder almost like a filing cabinet. This electronic filing cabinet is referred to as a hard drive.

A hard drive is a permanent storage device, because data stays on the computer even if it is turned off. Hard drives do fail eventually, which makes it imperative to save copies, or backup, of important documents. Casual computer users can also consider printing out important documents. Retail store outlets offer hundreds of printers available on the market, ranging from under one hundred to a couple thousand dollars. Casual computer users do not need commercial printers. Many people recommend multifunction printers to print, scan, copy, or fax documents. A phone line is required to send documents via the fax machine. In order to get the most out of the experience, most users learn how to use a keyboard. A keyboard has all of the basic layouts found on a typewriter. Computer users will need to find a basic keyboarding course to increase their typing speed and accuracy. A computer needs a modem in order to access the World Wide Web. A modem serves as a medium between the Internet and a computer. It enables the computer to connect to the Internet. Some

computers connect to the Internet through the telephone line, also known as a dialup service, although this has a very slow connection that will drive most computer users crazy after a while. Fortunately, Internet Service Provider ISP technology has advanced its connection speed. As a result, more people have switched over to highspeed broadband that uses a cable modem or a Digital Subscriber Line DSL to connect a computer to the Internet. Computer users who subscribe to a broadband service will enjoy all of the multimedia features available on the Internet. Computer users can usually sign up for DSL and broadband services at very competitive rates. Just call 18009224336 or Email us. Call 18009224336 or Email.
